NCI CGAP PITI1 is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I; and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)3 tail. The sequence tags for this library are GTGTG, ATCAT, GGGTG, GGTTG. For additional information, contact: Bento Soares,
                                                                                                                                CDNA Library preparation: Dr. M. Bento Soares, University of Iowa CDNA Library Arrayed by: Dr. M. Bento Soares, University of Iowa DNA Sequencing by: Dr. M. Bento Soares, University of Iowa Clone Distribution: Clone distribution information can be obtained from Dr. M. Bento Soares, bento-soares@dulowa.edu

The following repetitive elements were found in this CDNA sequence: 18-305, >RMERIOA#LTR (matched compliment)

(AMGE-) AMGEN INC.

Saris C;

WPI; 2003-874309/81. N-PSDB; AAD64754 New tmst2 nucleic acid molecule and polypeptide, useful for diagnosing, treating or ameliorating diseases associated with or resulting from abnormal tmst2 expression, e.g. sepsis, inflammation or cancer, or for chromosome mapping

Claim 1; SEQ ID NO 8; Opp; English.

The invention relates to transmembrane decoy-receptor (tmst2) proteins and their secreted splice variants, belonging to the tumour necrosis factor (TNF) receptor super gene family and polynucleotides encoding such proteins. The composition and methods are useful in diagnosing, treating or ameliorating diseases associated with or resulting from abnormal tmst2 and/or abnormal expression of its putative ligand, such as sepsis, cachexia, autoimmune diseases, inflammatory diseases, viral, bacterial and parasitic diseases or cancer. They may also be used for chromosome

```
The invention relates to transmembrane decoy-receptor (tmst2) proteins and their secreted splice variants, belonging to the tumour necrosis factor (TMF) receptor super gene family and polynucleotides encoding such proteins. The composition and methods are useful in diagnosing, treating or ameliorating diseases associated with or resulting from abnormal tmst2 and/or abnormal expression of its putative ligand, such as sepsis, cachexia, autoimmune diseases, inflammatory diseases, viral, bacterial and parasitic diseases or cancer. They may also be used for chromosome identification or mapping. The invention is useful in gene therapy. The present sequence is a fusion protein comprising mouse tmst2- receptor protein and human immunoglobulin Fc region. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; tmst2-receptor; acquired immunodeficiency syndrome; AIDS; anaemia; autoimmune disease; cachexia; cancer; cerebral malaria; diseaminated intravascular coagulation; haemorrhapic shock; hepatitis; insulin resistance; leprosy; leukaemia; lymphoma; meniatis; multiple sclerosis; ischaemia; obesity; organ rejection; rheumatoid arthritis; septic shock; stroke; adult respiratory distress syndrome; ARDS; tuberculosis; viral disease;

                                      The invention relates to a tmst2-receptor polypeptides and the polynucleotide encoding them. The sequences of the invention are useful for treating diseases and conditions including acquired immunodeficiency syndrome (AIDS), anaemia, autoimmune diseases, cachexia, cancer, cerebral malaria, diabetes mellitus, disseminated intravascular coagulation, haemorrhagic shock, hepatitis, insulin resistance, leprosy, leukaemia, lymphoma, meningitis, multiple sclerosis, ischemia, obesity, organ rejection, rheumatoid arthritis, septic shock, stroke, adult respiratory distress syndrome (ARDS), tuberculosis and a number of viral diseases. This sequence represents a murine tmst2-Fc fusion protein of the

Claim 13; SEQ ID NO 10; 57pp; English.

```
The invention relates to transmembrane decoy-receptor (tmst2) proteins dand their secreted splice variants, belonging to the tumour necrosis factor (TNF) receptor super gene family and polynucleotides encoding such proteins. The composition and methods are useful in diagnosing, treating or ameliorating diseases associated with or resulting from abnormal tmst2 and/or abnormal expression of its putative ligand, such as sepsis, cachexia, autoimmune diseases, inflammatory diseases, viral, bacterial and parasitic diseases or cancer. They may also be used for chromosome present sequence is mouse tmst2-receptor splice variant protein used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                        KNCSAGTFVKAPCEIPHTQGQCEKCHPGTFTEKDNYLDACILCSTCDKDQEMVADCSATS 120

                                          in invention treates to a unit in the sequence of the invention are useful for treating diseases and conditions including acquired immunodeficiency syndrome (ALDS), anaemia, autoimmune diseases, cachaxia, cancer, cerebral malaria, diabetes mellitus, disseminated intravascular coagulation, haemorrhagic shock, hepatitis, insulin resistance, leprosy, leukaemia, lymphoma, meningitis, multiple sclerosis, ischaemia, obesity, organ rejection, rheumatoid arthritis, septic shock, stroke, adult respiratory distress syndrome (ARDS), tuberculosis and a number of viral diseases. This sequence represents a murine tmst2-receptor splice variant
                                                                                                                                                                                                                                                                                                                                                                                                                           61 KNCSAGTFVKAPCEIPHTQGQCEKCHPGTFTEKDNYLDACILCSTCDKDQEMVADCSATS 120

The invention relates to transmembrane decoy-receptor (tmst2) proteins and their secreted splice variants, belonging to the tumour necrosis factor (TNF) receptor super gene family and polymucleotides encoding such proteins. The composition and methods are useful in diagnosing, treating or ameliorating diseases associated with or resulting from abnormal tunst and/or abnormal expression of its putative ligand, such as sepsis, cachexia, autoimmune diseases, inflammatory diseases, usiral, bacterial and parasitic diseases or cancer. They may also be used for chromosome identification or mapping. The invention is useful in gene therapy. The present sequence is mouse tunst2-receptor protein used in the

The invention relates to a tmst2-receptor polypeptides and the polynucleotide encoding them. The sequences of the invention are useful for treating diseases and conditions including acquired immunodeficiency syndrome (AIDS), anaemia, autoimmune diseases, cachexia, cancer, cerebral malaria, diabetes mellitus, disseminated intravascular coagulation, haemorrhagic shock, hepatitis, insulin resistance, leprosy, leukaemia, lymphoma, meningitis, multiple sclerosis, ischaemia, obesity, organ rejection, rheumatoid arthritis, septic shock, stroke, adult respiratory distress syndrome (ARDS), tuberculosis and a number of viral diseases. This sequence represents a murine tmst2-receptor polypeptide clone of the

             The present sequence represents a protein designated 7F4. This protein is scapable of inducing differentiation in osteoblast cells. The protein may be used to screen compounds for the ability to bind to it, for use as ligands, agonists or antagonists and inhibiting or otherwise altering its differentiation inducing activity. Compounds so identified, as well as the protein itself, DNA encoding it, and antibodies to it, may be used in the treatment of diseases of bone growth and osteoblast differentiation,
                                                                                                                                                                                                                                                                                                                                           TEVXAPCKIPHTQGQCEKCHPGTFTGKDNGLHDCELCSTCDKDQNMVADCSATSDRKCEC 116

tumour necrosis factor (TNF) receptor supergene family and nucleic acid diseases encoding such receptors. The invention is useful for detecting diseases or susceptibility to diseases related to the presence of mutated ymkz5-receptor gene such as tumours or cancers. The sequences of the invention are used as medication for a number of diseases such as acquired immune deficiency syndrome (AIDS), anaemia, autoimmune diseases, cachexia, leprosy, leukaemia, hepatitis, multiple sclerosis, myocardial ischaemia, obesity etc. The invention is also useful in gene therapy. The present sequence is mouse ymkz5 receptor protein.
                                                                                                                                                                                                                                               7
                                                                                                                                                                                                                                                                                                                                                                              116
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a transgenic non-human animal having the expression of FW4 gene artificially modified. The transgenic animals are a disease model for bone and glycolipid metabolism disorders. Substances identified by the screening method are agents for the prevention and

The invention is useful for detecting diseases or susceptibility to diseases related to the presence of mutated ymkz5-receptor gene such as tumours or cancers. The sequences of the invention are used as medication for a number of diseases such as

The transgenic animals are a disease model for bone and glycolipid metabolism disorders. Substances identified by the screening method are agents for the prevention and treatment of diseases including osteoporosis, obesity and diabetes. The present sequence represents the modified mouse 7F4 protein.

                                                                                          ઠ
                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed activity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its and its and its and its and its and its protein expression or biological activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fit, wipo.int/pub/published_pct_sequences

                                                                              The invention relates to transmembrane decoy receptor, ymkz5 belonging to tumour necrosis factor (TNF) receptor supergene family and nucleic acid sequences encoding such receptors. The invention is useful for detecting diseases or susceptibility to diseases related to the presence of mutated ymkz5-receptor gene such as tumours or cancers. The sequences of the invention are used as medication for a number of diseases such as acquired immune deficiency syndrome (AIDS), anaemia, autoimmune diseases, cachexia, leprosy, leukaemia, hepatitis, multiple sclerosis, myocardial ischaemia, obesity etc. The invention is also useful in gene therapy. The present sequence is mouse ymkz5 receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

OX40 antigen precursor - rat

N;Alternate names: nerve growth factor receptor homolog
C;Species: Ratuus norvegicus (Norway rat)
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 09-Jul-2004
C;Accession: $21783; $808036
R;Mailett, $3.; Fossum, $5.; Barclay, A.N.
EMBO J. 9, 1063-1069, 1990
A;Title: Characterization of the MRC OX40 antigen of activated CD4 positive T lymphocyte
A;Reference number: $12783; MUID:90214614; PMID:2157591
A;Accession: $12783
A;Molecule type: mRNA
A;Residues: 1-271 < MALA
A;Residues: 1-271 < MALA
A;Residues: 1-271 < MALA
A;Coss-references: UNIPROT:P15725; EMBL:X17037; NID:g57830; PIDN:CAA34897.1; PID:g57831
C;Superfamily: CD27 antigen; NGF receptor repeat homology
C;Keywords: growth factor receptor; transmembrane protein
F;1-19/Domain: signal sequence #status predicted < MAT>

Lacks a cytoplasmic death domain and hence is not capable of inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ISOUG-Q9ER62-2; Sequence=VSP_007648;
ISOUG-COPERING: Ubiquitous.
TISSUE SPECIFICITY: Ubiquitous.
TISSUE SPECIFICITY: Ubiquitous.
CAUTION: Ref.1 (CAC27353) sequence differs from that shown due to erroneous gene model prediction.
CAUTION: Ref.1 (CAC16406) sequence differs from that shown due to a frameshift in position 38.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  apoptosis. Protects cells against TRAIL mediated apoptosis possibly through ligand competition. Cannot induce the NF-kappa-B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROSITE; PS00652; TNFR NGFR 1; 3.
